

Scar Gel

with panthenol and birch

A scar always occurs as a result of tissue injury. Scar-tissue is less elastic and less supplied with blood why tissue hardening can occur. Scar Gel contains 5% dexpanthenol, that stimulates the skin metabolism and promotes regeneration. Furthermore dexpanthenol increases the moisturizing capacity of the skin. Additionally, high-quality birch bark extract supports these positive qualities.

Application: Apply the gel 2-3 times daily on the affected area in gentle circling movements.

Ingredients: Aqua, Panthenol, Pentylene Glycol, Propylene Glycol, Acrylates/C10-30 Alkyl Acrylate Crosspolymer, Betula Alba Bark Extract, Glycerin, Potassium Sorbate, Benzyl Alcohol, Sodium Hydroxide.
